Brewer's grain

Brewer's grain, pelletized dry - a valuable food product containing proteins, carbohydrates, lipids, the content of which corresponds to the technical specifications (TU U 15.9-05391057-006: 2007) and are intended for feeding animals by direct injection into the diet of the animals, as well as for the production of animal feed and feed mixtures . Brewer's grain - a precipitate which formed after filtration of the beer wort in the form of cheese has a moisture content of about 80%.

With a new installation it is drained to a moisture content of 67% and dried. To increase the content of high-grade protein and B vitamins for drying served as brewer's yeast. The plant capacity is up to 700 tons of raw grains per day. Shelf life of dry spent grains - 6 months.

Brewer's grain estimated values	
Colour	Light or dark brown
Smell	Specific
Appearance	Pellets
Crude fat on abs. dry substance, %	Max. 12,0
Crude protein on the abs. dry substance, %	Max. 19,0
Humidity, %	Max.12,0
Cellulose, %	Max. 22,0
Ash, %	Max. 6,0
